Switching Relay Series MEMS Inclinometer

Input Protection Circuitry

- Reverse Polarity Protected
- Overvoltage Protected up to 60VDC
- CE Compliant Protection – Resists surges up to 500V and 250A

Sensor Fusion Algorithm

Our advanced algorithm provides excellent dynamic accuracy for high vibrate and high acceleration conditions.

V+ Switch

The digital V+ switch will send the protected input supply voltage to the outputs when activated. Otherwise, it will be an open circuit when inactive.

Output Protection

The output protection circuit will shut off the outputs during a short circuit or over-current situation, keeping the device protected.

Customize your inclinometer

- Marine-Grade Stainless or Aluminum enclosures
- Wiring or connector options
- Add CANBUS Communication
- Pair with our wireless transmitters
- Custom configurations allow us to alter the trip angles, trip delays, reset delays, etc.

LEVELING THE WORLD

The Switching Relay Inclinometer has a wide array of uses. Our team of engineers can work with you in order to create the sensor that fits your application. Whether its legacy units, drop-in replacements, or new applications, 2GIG can provide the correct settings for your application.
